

NetPractice

This project is a general practical exercise to let you discover networking. You will have to configure small-scale networks. To do so, it will be necessary to understand how TCP/IP addressing works.

This project is about solving networking problems to make a network run.

For each level, a non-functioning network diagram appears.

At the top of your window, you will see a goal to achieve: the issues to solve so that the network runs properly.

To complete this assignment, it is strongly recommended to understand how addressing works in a network in which there are devices such as routers. Read about TCP/IP addressing.
